

Operations integration

A window that ~~see~~ shows current and past recent operations

- per file / tree structured
- globally / flat list
- filtered by kind of operation
- statistics like IOPS / MBPS
- idle periods
- bandwidth used by remote backends
- space saved by compression / zero-copy

unix commands integration

copying recursive:

- 'cp -R source dest' could be done
with zero-copy immediate operation

deletion recursive:

- 'rm -R path' could be done
as one major operation

Failure scenario #1

Use all possible space/inodes/etc.

Can you remove anything after reaching full capacity or are you stuck?

Btrfs gets clogged.

Ext3/4 gets clogged.

Failure scenario #2

Start copying huge file > 10-20GB.

Everything in the system slows down, becomes unresponsive. Is that buffer cache being saturated?
